

## Abstraction design overview

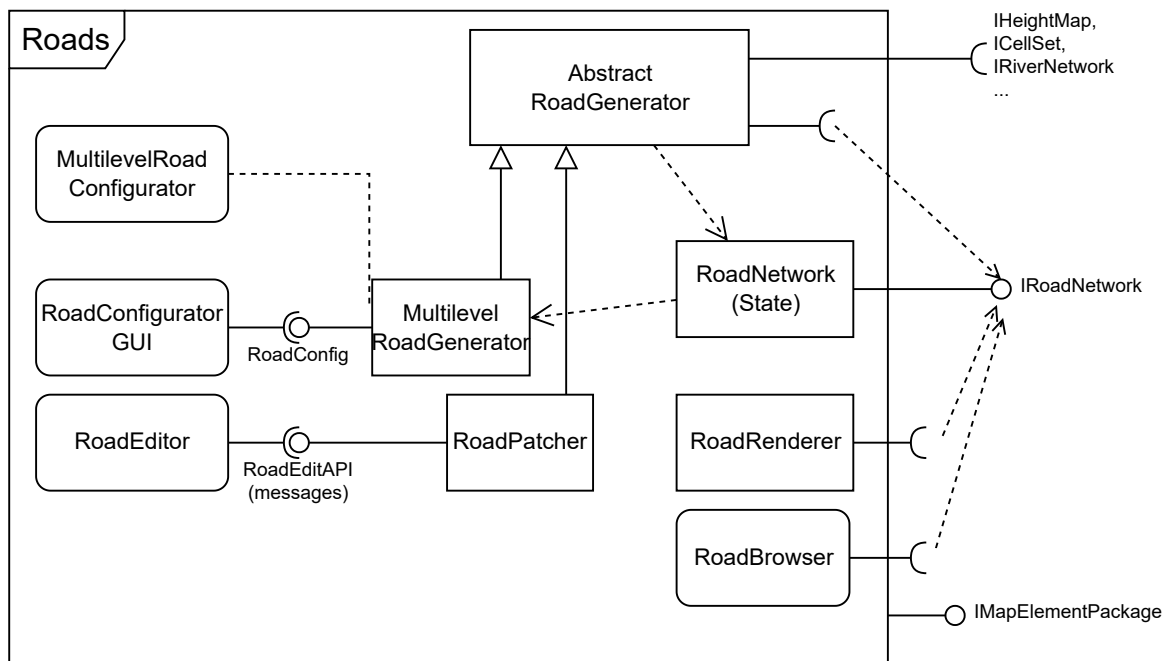

## Modularity

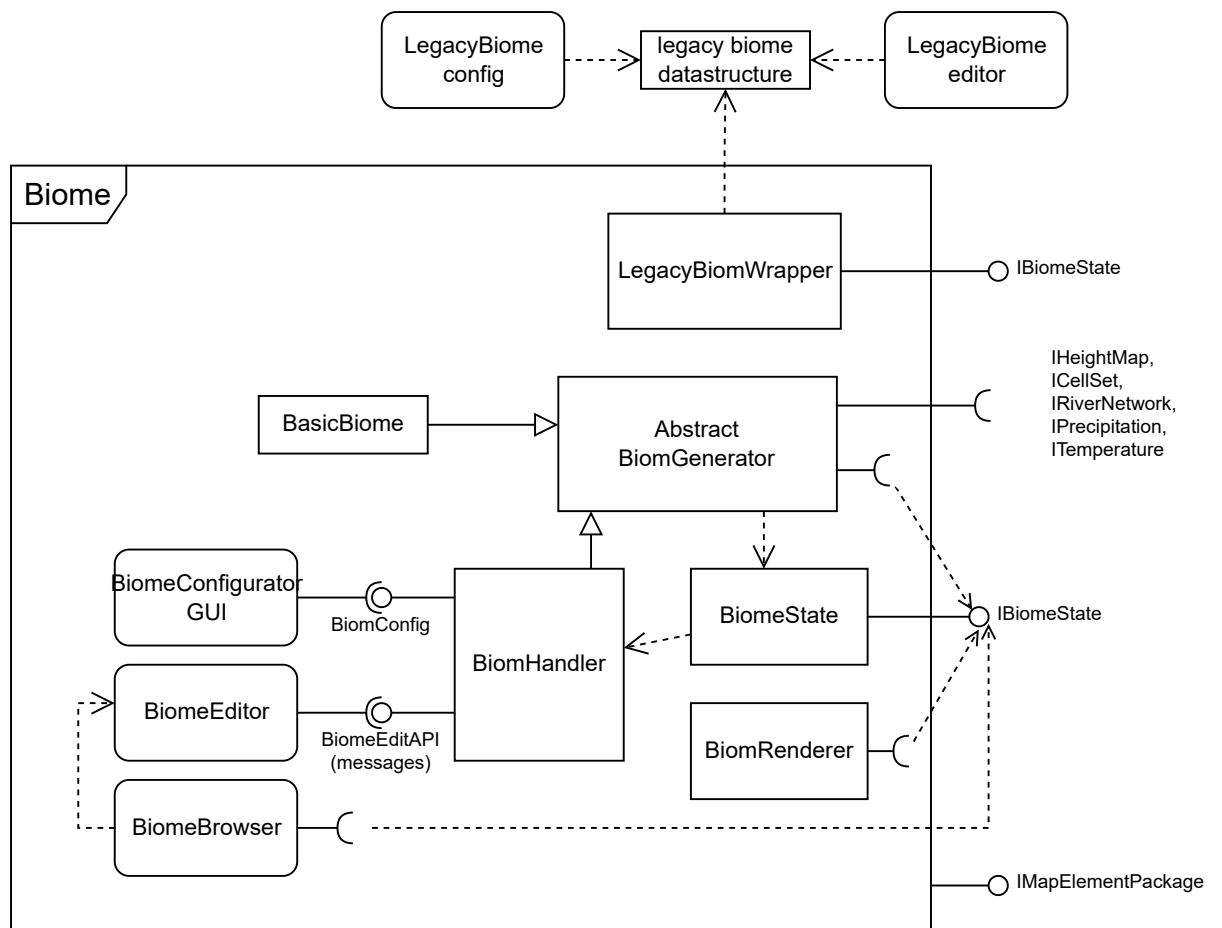

## Module overview

## Package examples

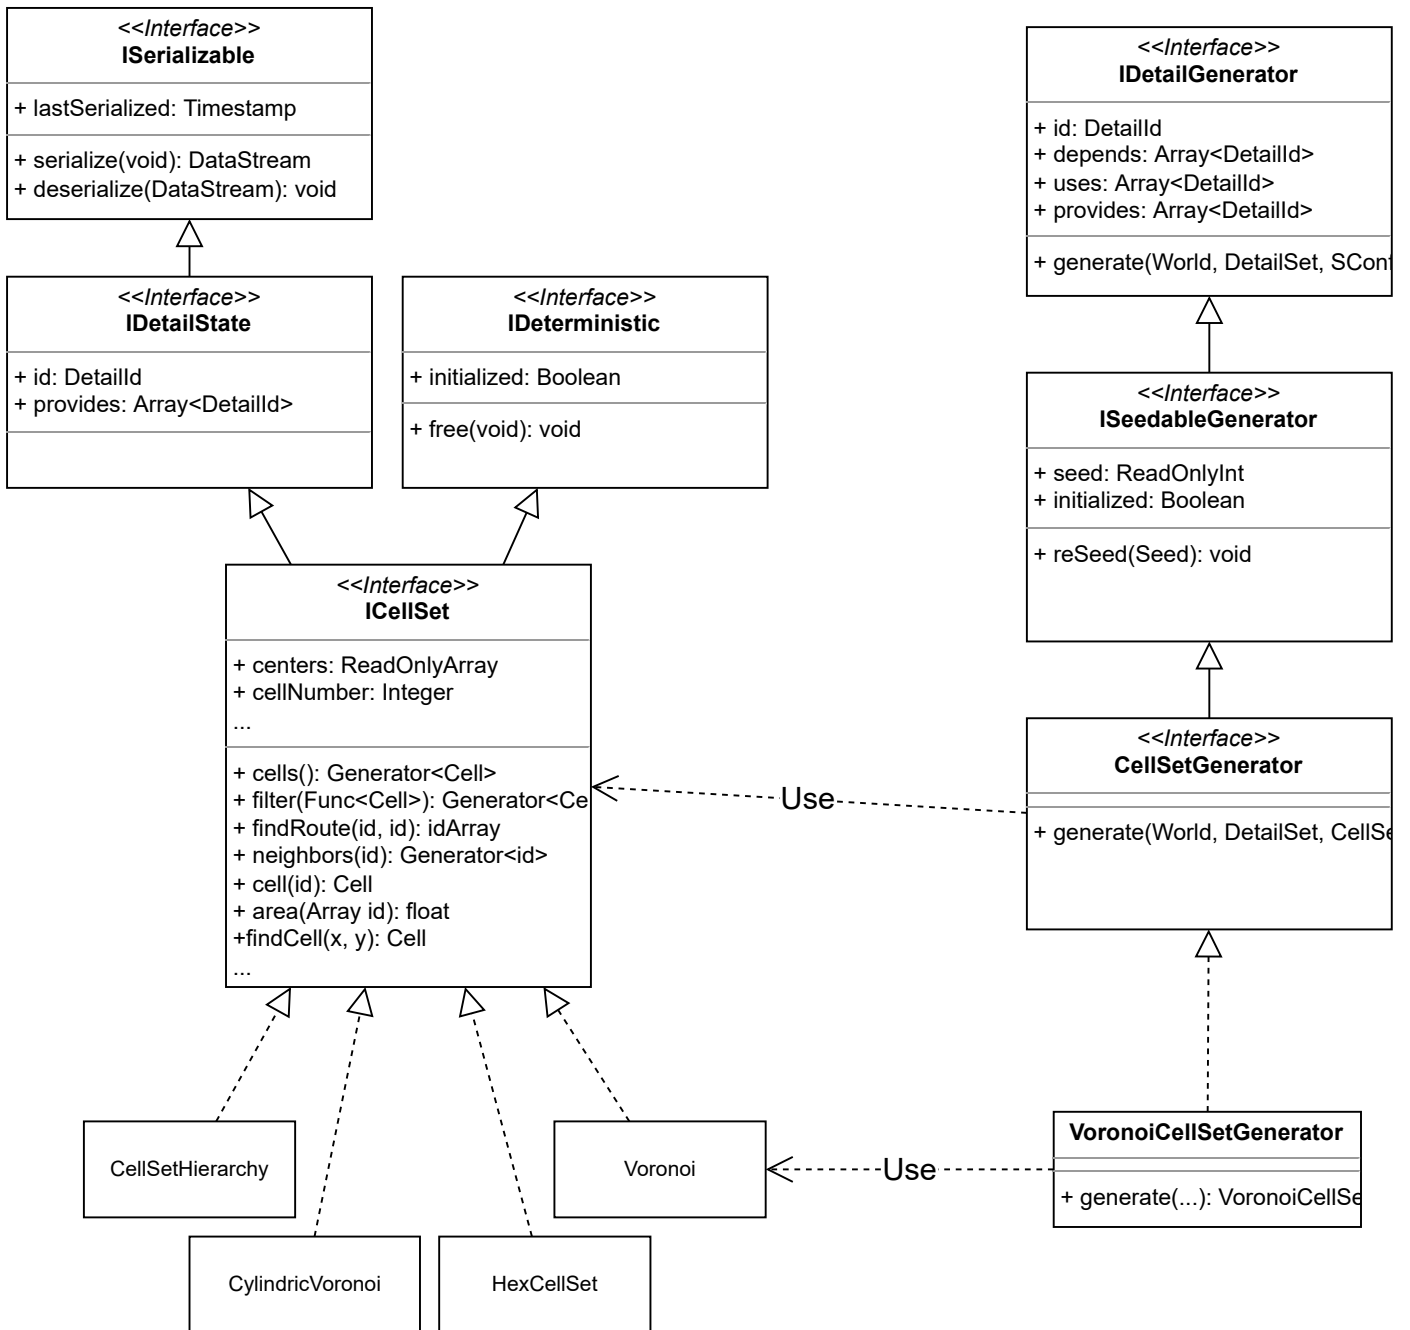

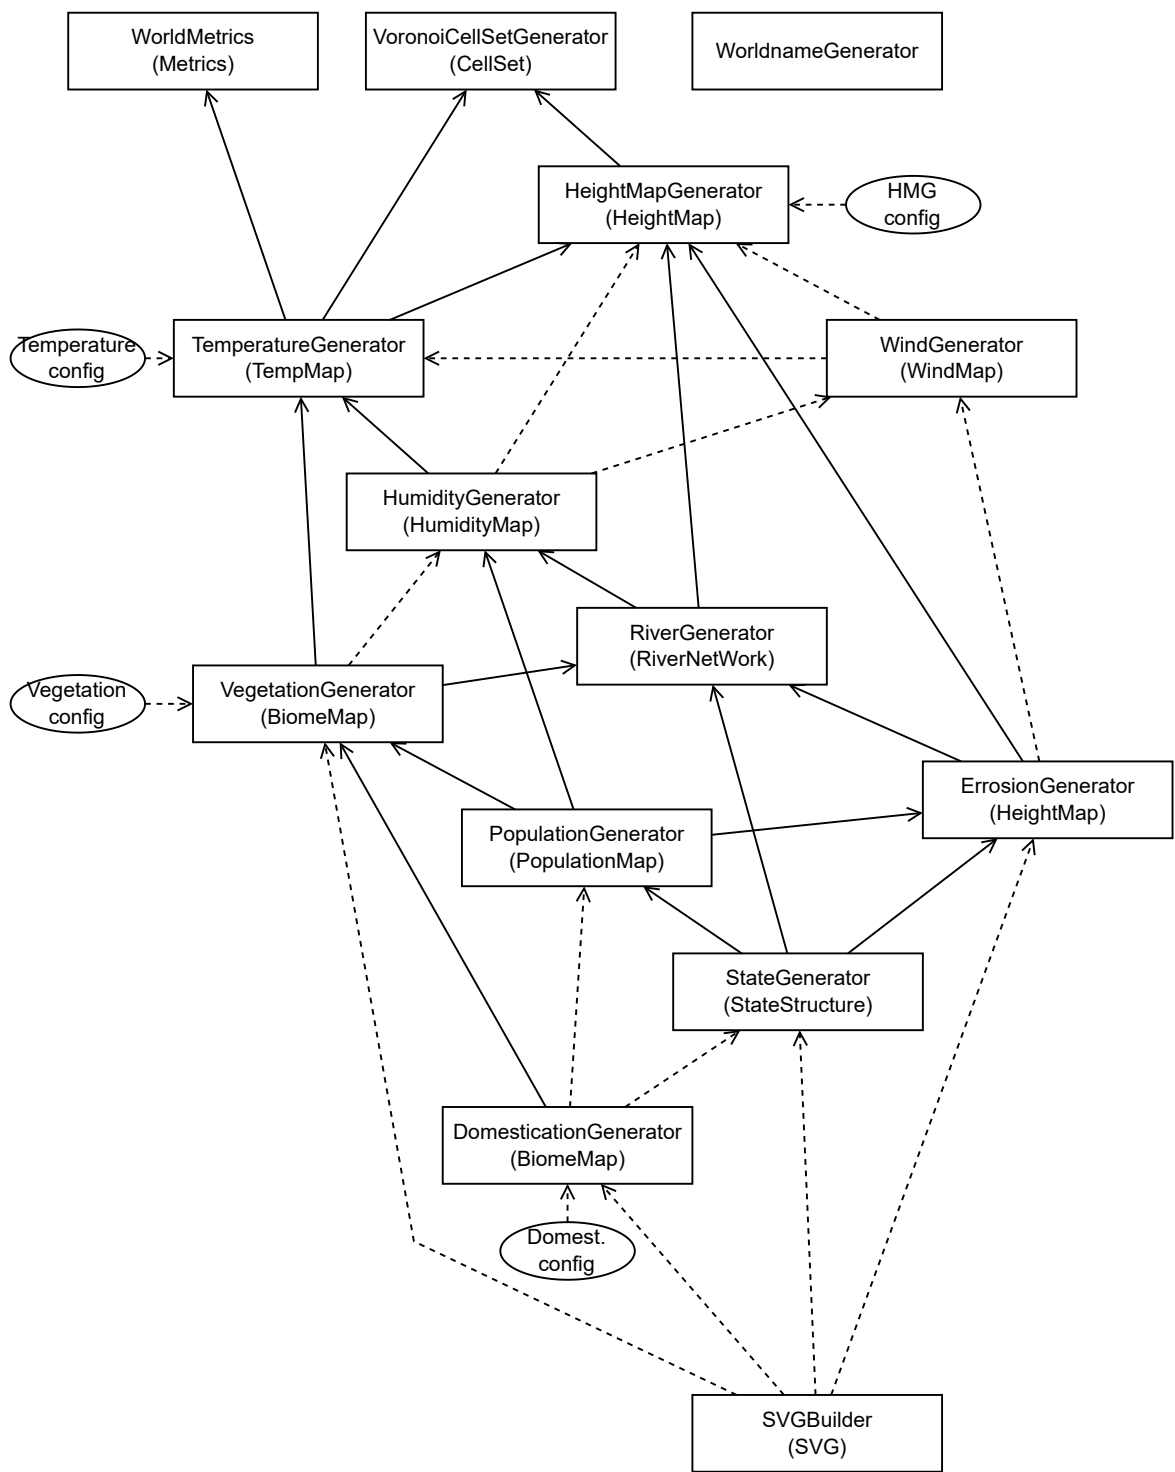

Modular design using patcher and generator context

Supporting multiple generators, legacy generators/data, alternate GUI

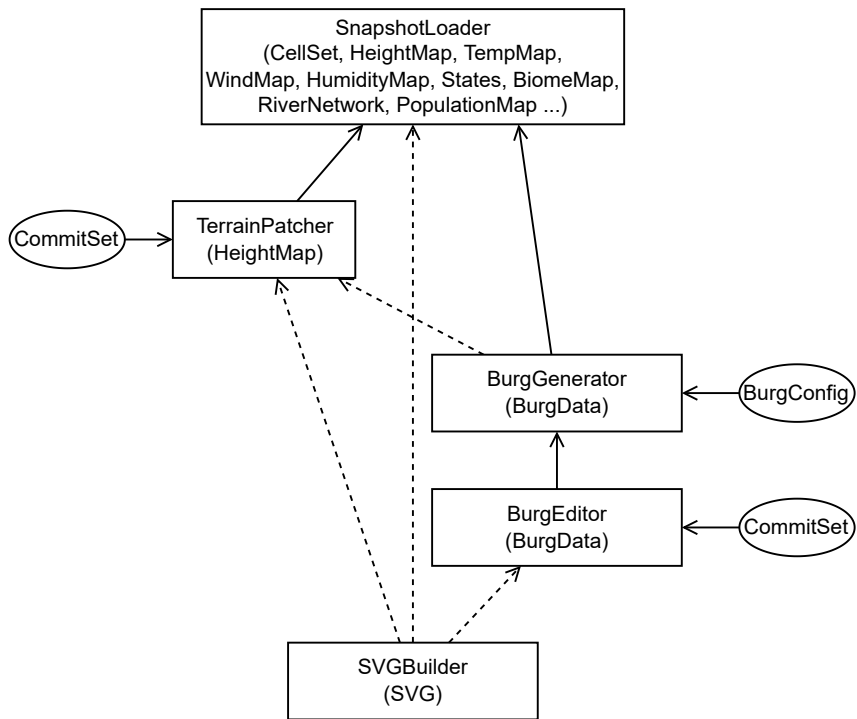

## Example: StructureData API (CellSet)

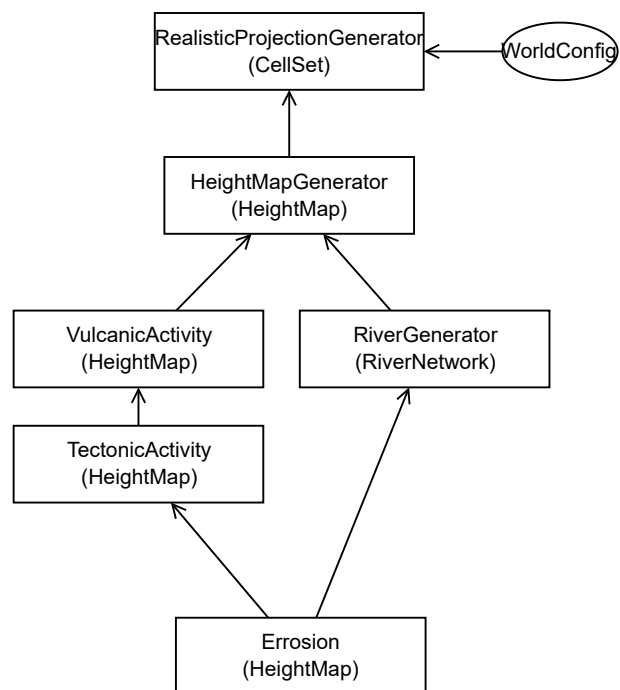

\*All generators depend on VoronoiCellSet and most generators depend on WorldMetrics. These dependencies are not marked for brevity.

Example #1: Custom deterministic configurable world building  
DAG

Example #2: Preset and editing DAG

Example #3: Multilevel heightmap generation DAG
